

“A useful workflow to compare different 2D and 3D visualizations of alpine regions.”

Master Project Work, D-BAUG, Spring Term 2014
Institute of Cartography and Geoinformation, ETH Zurich

Student: Maria-Vasiliki Kourouni

Supervising Professor: Prof. Dr. Lorenz Hurni

Supervisors: Dr. Christian Häberling
Aline Brüngger

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

Motivation

- ***Shortness of user testing*** methods for cartographic visualizations (map-user-tests), either on 2D or 3D visualizations
- ***Need to find new easy methods*** to handle them

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

Main goal

- To develop and provide a useful and easy-to-handle **workflow** for a comparative user evaluation of two different visualizations, especially of a 2D map and a 3D perspective view of an alpine region

Introduction

Motivation

Main goal & sub-goals

The proposed new

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

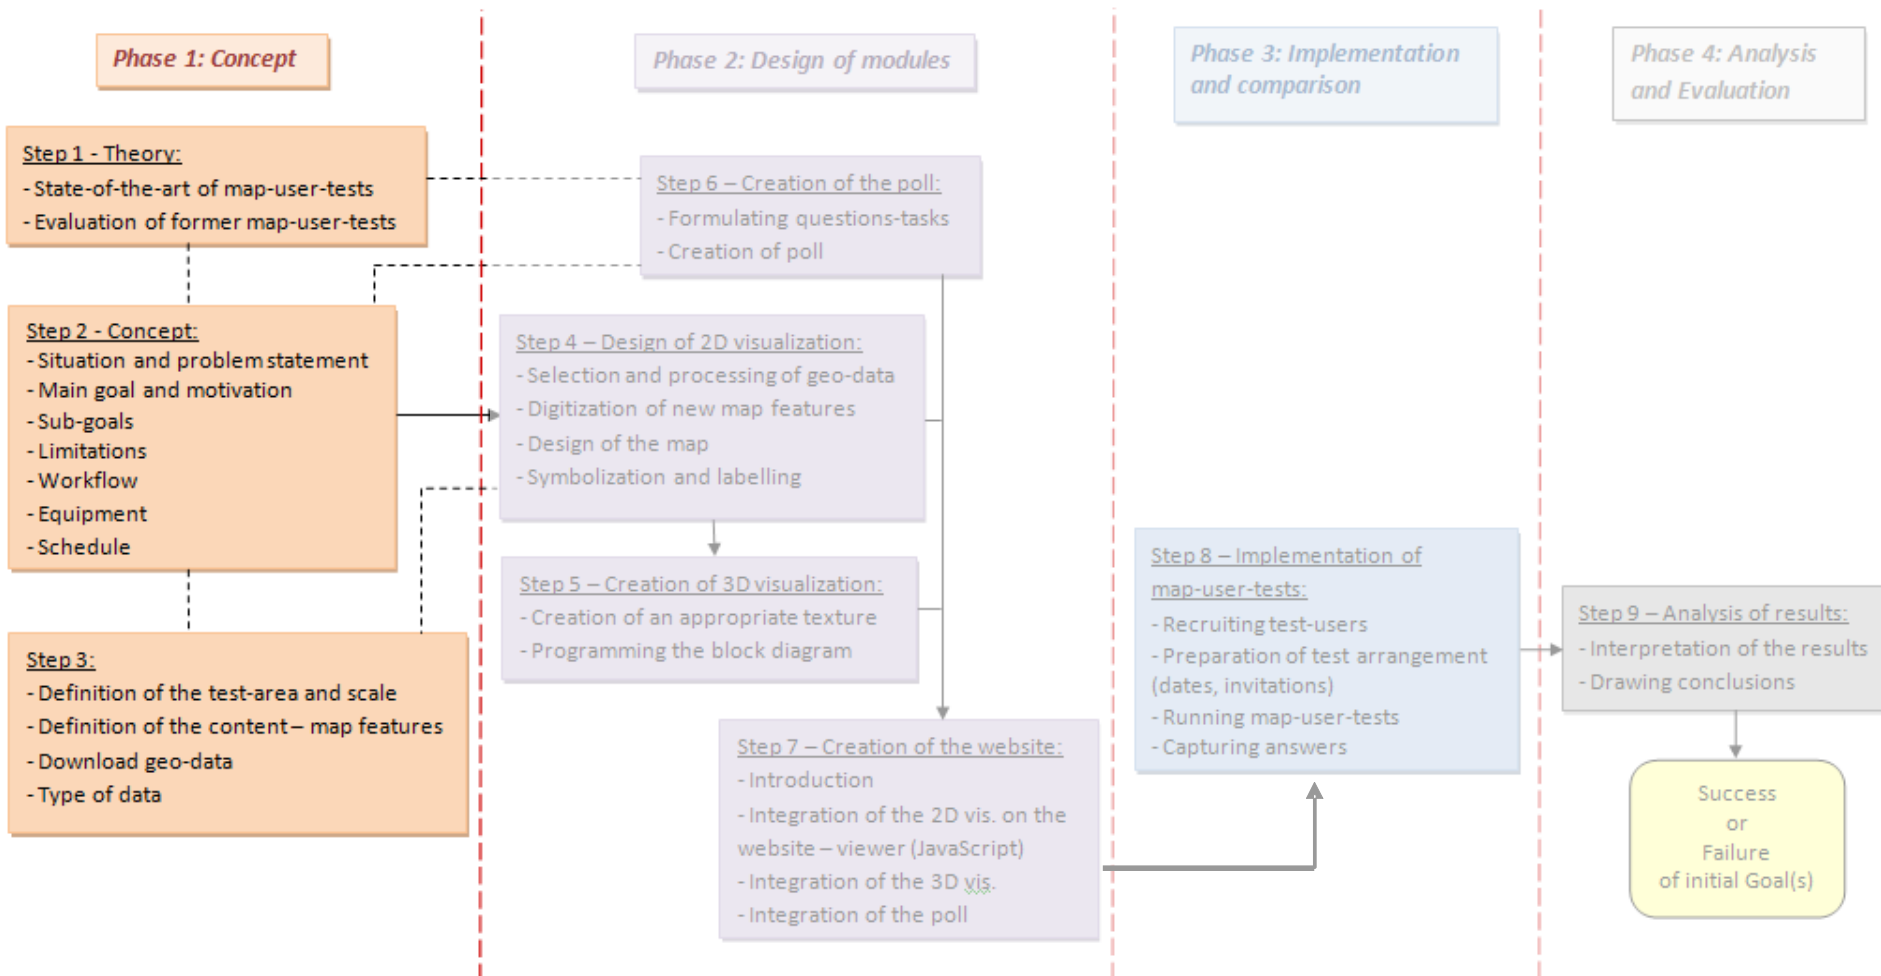

Analysis of the results

Conclusions & Outlook

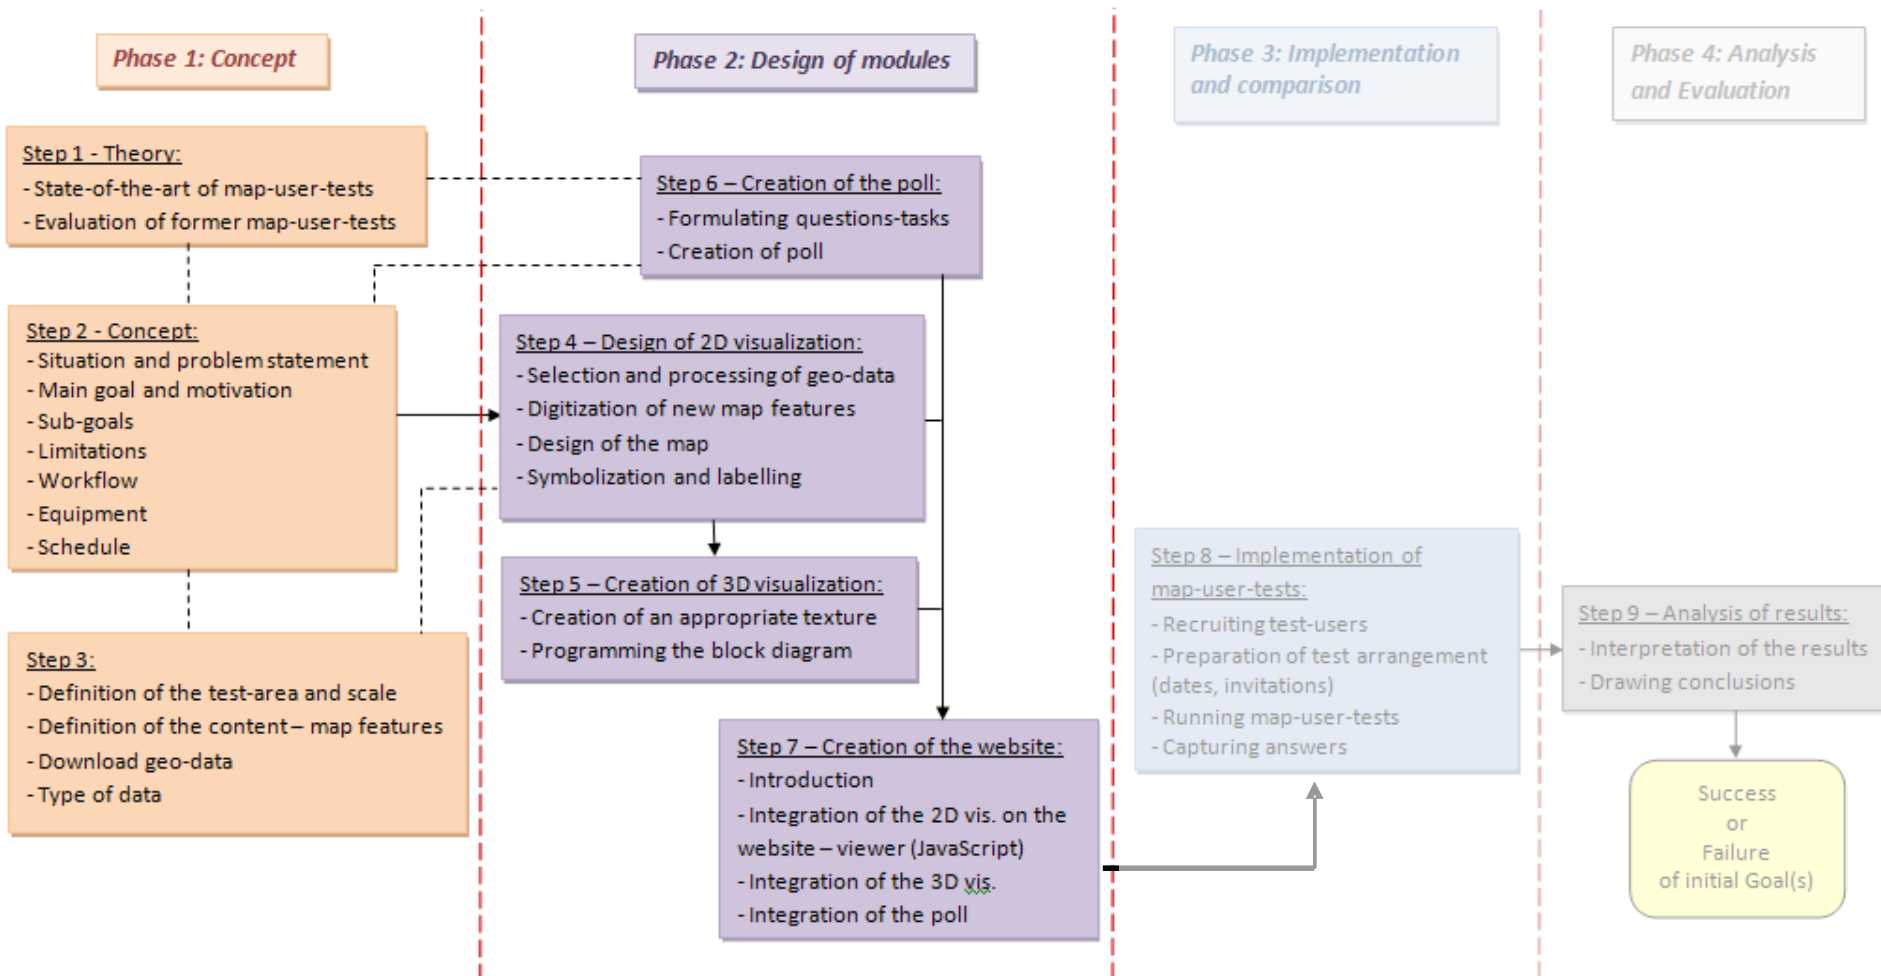

Sub-goals

- Design of a **2D visualization** of a selected alpine region
- Creation of a **3D visualization** of the same alpine region
- The **comparison** between the derived 2D and 3D visualization presented on a **website** carried out by a **poll** with questions and tasks
- The procedure of the **pilot study** with test-users
- The evaluation of the **workflow**

the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

Until now different methods were used for the evaluation of map visualizations.

- Questionnaires, interviews: time-consuming, easy to handle?
- Controlled indoor or outdoor settings
- Sample of test-users: experts or not, small or big sample
- Combination of methods

Limitations

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- The simplicity of the workflow may lead to **general conclusions**.
- Specific process steps of the workflow may not be considered simple by the **map-designers**.
- Areas with ambiguous three-dimensionality, **flat areas**, are not ideal for the creation of 3D visualizations.
- The **parallel comparative evaluation** of two visualizations on a website is **not advisable** because of limited space of the computer screen.

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Aim of the map: depiction of hiking paths of Mt. Rigi
- Target group: hikers/tourists of Rigi region
- Realistic impression of the tourist facilities of Mt. Rigi
- Pseudo-natural design: summer-season design (forest/pastures)
 - bright settlement areas and roads
 - shaded relief
- Data VECTOR25 from swisstopo
- Technology used: ArcGIS, QGIS, Adobe Illustrator

The 2D visualization (tourist map) *Step 4*

Test-area

2D visualization

3D visualization

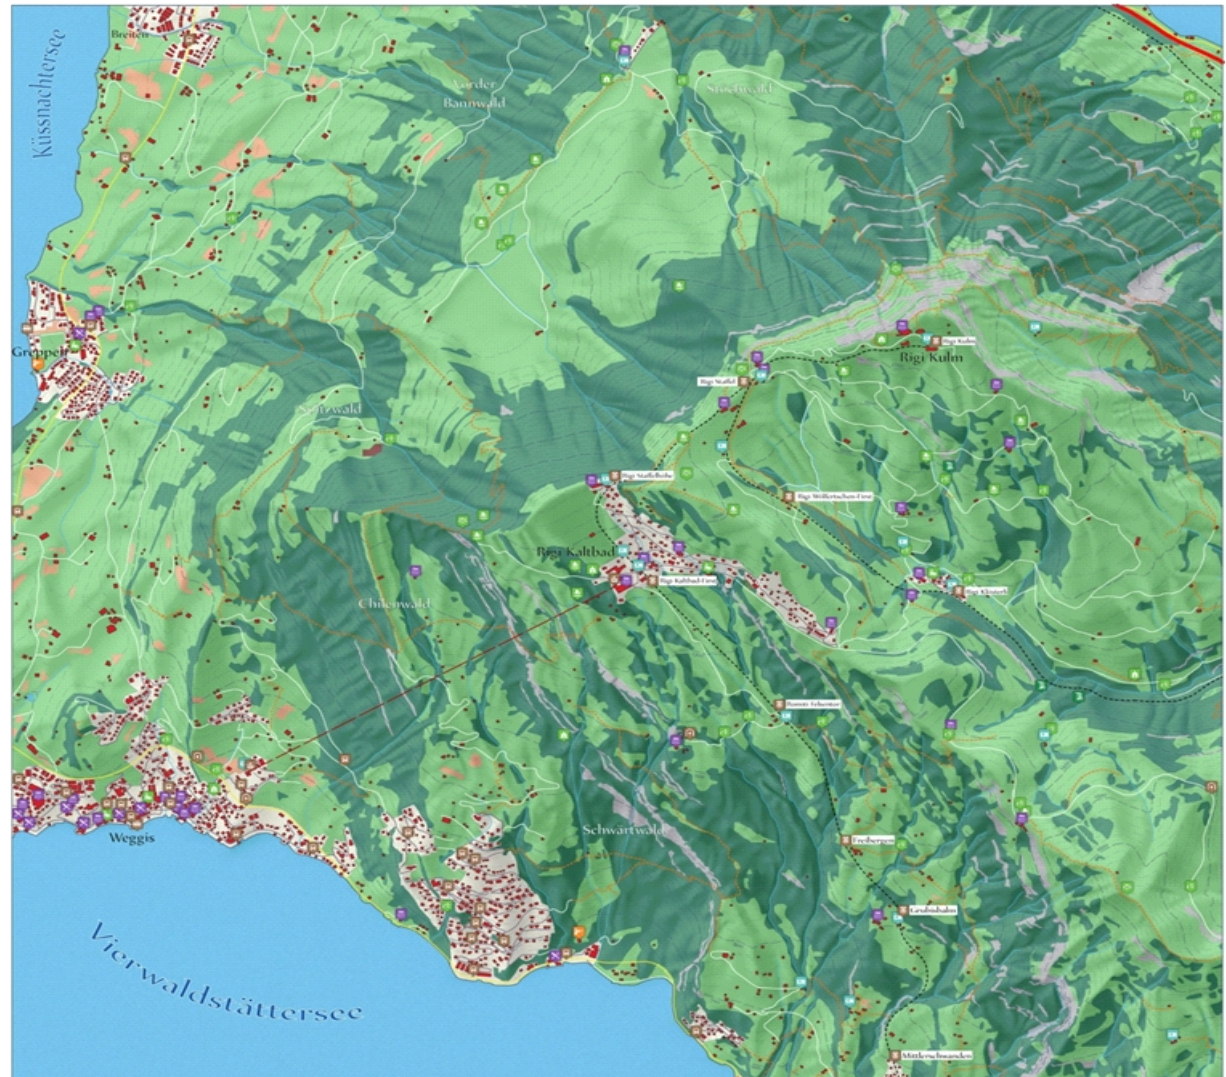

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

The structure of the questionnaire is:

1. ***Individual characteristics – background information***
(age, gender, experience on reading maps etc.)
2. ***Map content*** (interpretation of map features)
3. ***Cartographic communication***
4. ***Orientation***
5. ***Map design preference – Map comparison***

Creation of a poll

the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Preformed polls for their integration on a website.

Map user test on the 2D visualization

Part 1: Individual characteristics

***Required**

What is your age? *

- 15 to 20
- 20 to 25
- 26 to 40
- 41 to 60
- over 60

Gender? *

- male
- female

Have you ever hiked/been at Rigi, Switzerland? *

- Never
- Once
- Just a few times
- I often go to Rigi!

How often do you use maps? *

- I don't use maps at all!
- I just use them only when I cannot avoid it.
- I often use maps.
- My studies/work are in the field of cartography or a related field.

Creation of the website

Introduction

schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Layout: simple and easy to handle
- Structure concept: three web pages
 1. Introduction page
 2. Map-user-test on the 2D visualization
 3. Map-user-test on the 3D visualization
- Upload to the server **hg.n.ethz.ch**
- Possibility to evaluate first the 2D either the 3D visualization so creation of 5 web-pages, so 4 different polls

- **Website presentation**

Implementation of map-user-tests *Step 8*

Motivation

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Pre-testing of map-user-tests
- Recruitment of test-users: asked by email
- 60 persons asked, 35 experts
- Duration: May 5th to May 15th, 2014
- Capturing of the answers:
 - collected and automatically connected to a Google spreadsheet
 - summaries of the responses presented through pie charts
- evaluating first the 2D visualization: 12 valid answers
- evaluating first the 3D visualization: 2 valid answers
- Difficulties recognised

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

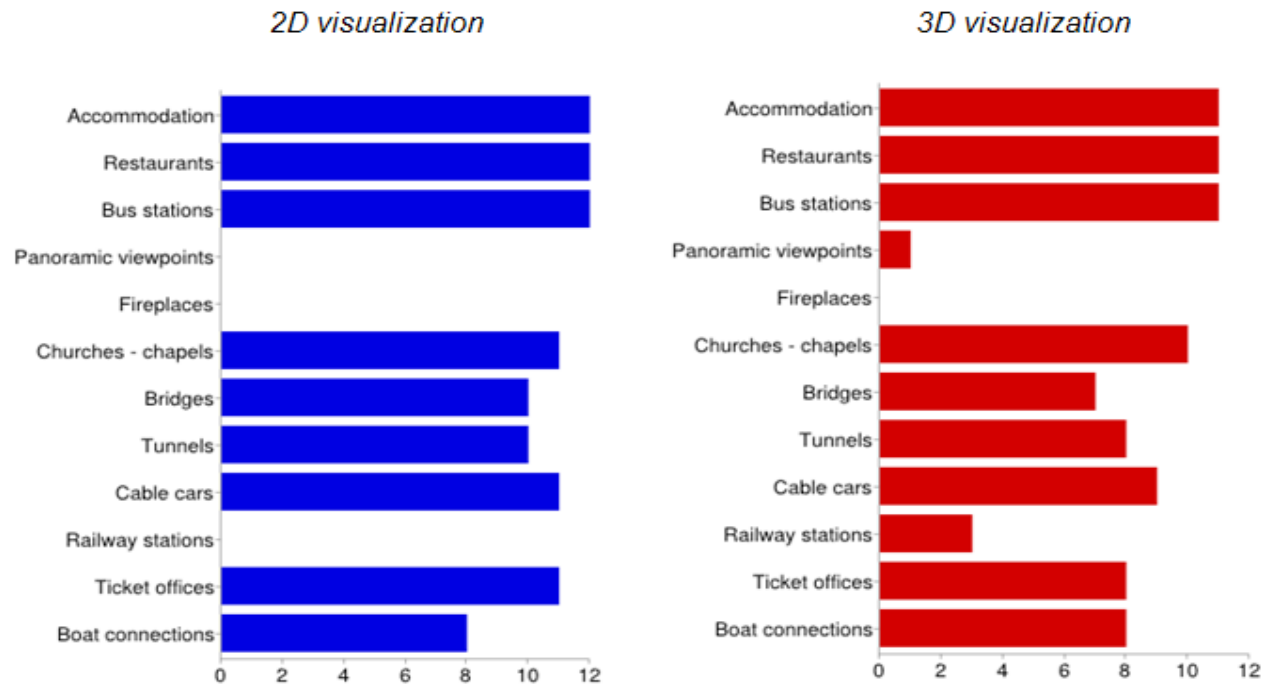

Conclusions & Outlook

- The results are **not** really **representative** because only “a few” test-users participated.
- **More correct answers** recorded at the map-user-test of the **2D** visualization
- **More correct answers** recorded at the map-user-test of the 3D visualization when **first evaluating the 2D** visualization
- **No important differences** at the answers of **experts** and **non-experts**
- The **older age group** (26-40) gave **more correct answers** than the younger one (20-25).

Interpretation of the results

Step 8

Introduction

Motivation

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- **Preferred** visualization: **2D** visualization
- Better depiction of the **reality**: **3D** visualization
- **Easier to read**: **2D** visualization
- More accurate visualization:
 - males: 3D visualization
 - females: 2D visualization
- 2D and 3D visualizations proved equally efficient for cartographic communication
- 3D visualization: females not easily oriented

Conclusions (1)

Introduction

Motivation

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Main goal achieved: an easy-to-handle and useful workflow
- 2D visualization: easily designed by an expert map-designer
- 3D visualization: difficulties with the functionalities of the block diagram and the presence of icons/labels
- The creation of a website does not require expert programming skills
- The questions for the 2D and 3D should have been different but same level of difficulty
- Easy formulation and integration of GoogleDrive polls on the website
- Carefully selected sample and sufficient number of test-users

Conclusions (2)

Introduction

Motivation

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Email: not the optimal technique for the conduction of user-questioning
- The submitted answers lead to some general, but important conclusions about the two visualizations
- A comparative evaluation is possible even if the two visualizations are evaluated separately.

Outlook

Introduction

Motivation

Main goal & sub-goals

The proposed new
schematic workflow

The implementation of
the workflow

State-of-the-art

Limitations

Test-area

2D visualization

3D visualization

Poll

Website

Conduction of
map-user-tests

Analysis of the results

Conclusions & Outlook

- Other visualizations may be integrated on the web-pages for their comparative evaluation
- 2D visualization: more interactivity is possible
richer GUI
- 3D visualization: panning of the block diagram
creation of billboards of the icons/labels
interactivity and richer GUI
- Formulation of questionnaires examining more specific aspects on cartographic visualizations (eg. design aspects etc.)
- More optimal data collection technique for the user-testing on the visualizations (eg. combination of questionnaires and interviews)
- Probably a more careful selection of the sample (eg. only experts in one session, only non-experts map-users in another session etc.)
